An election can end with a victory speech and still leave the people who voted for change waiting outside a locked door. Imagine a party winning the presidency, the House of Representatives, and enough seats to control the Senate. Its candidates promised to address a problem that has followed people home for years: medical bills they cannot pay, wages that cannot keep up, or a government policy they believe has done real harm. The celebrations suggest that the country has finally chosen a direction. Then a bill reaches the Senate, a majority supports it, and the effort stalls. To someone watching from home, the explanation can sound almost insulting: the winning side has enough votes to pass the proposal but cannot secure the vote that would allow it to pass. Meanwhile, another household watches the same development with relief. Its members believe the proposed law would create a different set of injuries, and they are grateful that winning an election did not give its sponsors unlimited freedom. Between those two households sits the filibuster, a Senate practice that allows opponents to delay or prevent action through extended debate or the threat of it. Understanding the argument requires spending time in both homes without forgetting what is happening inside the chamber.

The arithmetic becomes easier once we separate the decisions the Senate is making. Congress, the national legislature, consists of two chambers: the House and the Senate. A bill, meaning a proposed law, generally must pass both in identical form before going to the president. The Senate has one hundred seats, two for each state. On the final passage of most ordinary bills, a simple majority is sufficient: more senators voting yes than no, with enough senators present to conduct business. If all one hundred vote, fifty-one can approve a bill; a fifty-fifty tie can also be broken by the vice president. Before reaching that final decision, however, senators may have to vote on cloture, the procedure that limits further debate and moves the chamber toward a decision. On most legislation, cloture requires three-fifths of senators duly chosen and sworn, normally sixty. It is a supermajority requirement, meaning a threshold higher than a simple majority. Thus, fifty-nine senators can vote to bring debate toward a close, forty-one can oppose them, and the cloture motion can fail. The bill itself has not necessarily been voted down. Its supporters may have been prevented from reaching the vote on whether it should become law. www.senate.gov

Television has given this procedure a more exhausting appearance than it always has in practice. The familiar filibustering senator stands at a desk through the night, speaking until the voice weakens and the room grows impatient. That kind of effort can occur, but a modern filibuster need not depend on a continuous performance. Much Senate business proceeds through unanimous consent, an agreement that takes effect when no senator objects. Objections can force the chamber to use slower procedures, and the threat of extended debate can persuade the majority leader to set a bill aside rather than spend valuable time pursuing a cloture vote that cannot succeed. A single senator can cause delay by withholding cooperation, although one senator alone does not possess an unlimited power to defeat any ordinary bill. Sustained obstruction depends on enough resistance to keep the majority from overcoming it. This is why an almost empty chamber

can coexist with a blocked proposal. The absence of a dramatic speech does not prove the absence of a filibuster; sometimes the most consequential exercise of power is the warning that makes leaders abandon a vote before the public ever sees it.
EveryCRSReport.com

There is a reason a country might deliberately give the losing side this kind of influence. An election selects officeholders, but people vote for them for different reasons. One voter may support a candidate's tax policy while disliking that candidate's position on surveillance. Another may care almost entirely about health care. A narrow victory cannot establish that the public has agreed to every provision of every bill the winning party later writes. In a Senate where the majority party holds fifty-one seats, the ordinary sixty-vote cloture threshold can require it to find nine additional supporters if its own members remain united. Those additional senators bring other constituencies into the negotiation. They can demand safeguards, identify practical failures, and insist that officials explain what a sweeping proposal will do once it leaves Washington. The strongest defense of the filibuster begins here, with the belief that a national law should sometimes need more than the votes of the people who happen to control government. The difficulty lies in determining whether the extra votes are purchasing a better law, a narrower law, or the assurance that there will be no law at all.

Consider a hypothetical health-care proposal intended to lower the cost of treatment. A family waiting for relief sees months of delay as more months of borrowing, postponed appointments, and choosing which bill can remain unpaid. A hospital administrator examining the same legislation discovers that its payment formula could leave a rural hospital unable to keep an essential service open. A senator who uses the threat of a filibuster to get that formula repaired may be protecting the very patients the proposal was supposed to help. In that version of events, negotiation improves the law because someone had enough power to make its authors listen. But imagine that the sponsors correct the problem and the senator still refuses to cooperate because the opposition party would rather campaign against an ineffective government than help the governing party succeed. The family's need has become part of an election strategy. Nothing in the sixty-vote threshold can distinguish those motives. The procedure supplies leverage, meaning the power to obtain concessions by withholding something another side needs; the people using that leverage determine whether it serves careful lawmaking, partisan advantage, or both. From the family's position, the difference can be difficult to discover until another year has passed.

This is where the promise of compromise encounters the incentives of politics. Compromise is most likely when both sides want an agreement and disagree over its contents. If senators want a transportation bill, they can negotiate over spending levels, safety requirements, and which projects qualify for assistance. The need for additional votes may bring neglected concerns into the discussion. Yet the opposition may sometimes gain more from denying the majority an achievement than from shaping the achievement itself. A senator can believe that helping pass even a reasonable bill will make the other party harder to defeat. Under those conditions, asking the majority to

negotiate harder may misunderstand the obstacle: an agreement is precisely what some participants are trying to avoid. Bipartisanship, meaning cooperation across party lines, becomes possible when enough people on both sides are willing to accept shared ownership of a result. The filibuster can make their cooperation necessary, but it cannot make them want it. The same bargaining power that helps a conscientious senator correct an error can help another senator keep an unresolved problem available for the next campaign.

For the voter who expected the election to produce action, the result can become a confusing exercise in assigning responsibility. The majority says it tried to govern and was blocked. The minority says the majority failed to deliver. Both can point to events that occurred while leaving out the decisions that produced them. Advocates of ending the filibuster argue that government would become easier to judge if an elected majority had a greater opportunity to enact its program and answer for the consequences. Its promises would finally encounter the demands of implementation: finding money, writing workable rules, and accepting responsibility when results disappoint. There is also a cost to the current arrangement that the word "inaction" can conceal. The status quo, meaning the existing state of affairs, continues operating while Congress argues. People still receive its benefits and suffer its failures. An unchanged health-care policy still determines who can afford treatment; an unchanged labor law still shapes the relationship between employers and workers. Leaving those arrangements in place is a governing decision, even when it arrives through a failed procedural vote rather than a newly signed law.

To understand how the Senate acquired this additional barrier, it helps to separate the Constitution from the rules senators have developed under it. The Constitution establishes a Senate with equal representation for states, long terms, and staggered elections. It also expressly requires supermajorities for certain decisions, such as overriding a presidential veto, convicting an impeached official, or consenting to a treaty. It does not prescribe sixty votes for ordinary legislation. The Senate's practices of extended debate and its procedures for limiting that debate developed over time. In 1917, the chamber adopted a cloture rule permitting a two-thirds vote to limit debate. In 1975, it lowered the usual threshold to three-fifths of senators duly chosen and sworn. The sixty-vote requirement therefore has institutional weight, but it is not a command the Constitution placed beyond the Senate's ability to reconsider. Calling it a tradition describes its history; whether it deserves preservation requires an argument about its effects. Equally, pointing out that senators can change it does not establish that changing it would improve the country. The power to revise a rule and the wisdom of a particular revision are separate questions. www.senate.gov

The word "minority" becomes especially difficult when we reach the filibuster's civil-rights history. During the era of Jim Crow, the system of laws and practices enforcing racial segregation and unequal treatment, Southern senators repeatedly used obstruction to defeat federal civil-rights and anti-lynching legislation. At the same time, Black citizens in the South faced disenfranchisement, meaning the denial or suppression

of their ability to vote, through discriminatory laws, intimidation, and other barriers. The relationship between those forms of power deserves close attention. Citizens were excluded from full participation in choosing their government, while senators defending the existing racial order could block federal efforts to challenge it. A defense of political minority rights inside the Senate could therefore operate against the rights of a vulnerable minority outside it. Calling those senatorial privileges "minority rights" did not change whose civil rights were being denied. The people protected by a legislative rule are the people positioned to use it. A rule does not automatically defend the powerless merely because its supporters describe it as protection for a minority. www.senate.gov

On June 10, 1964, the distinction between debate and decision became visible in one senator's hand. California senator Clair Engle was gravely ill with a brain tumor and could no longer speak. When his name was called during the cloture vote on the Civil Rights Act, he pointed to his eye to signal an affirmative vote. The bill had occupied the Senate for sixty working days, and its supporters needed a two-thirds vote to overcome the filibuster. Cloture passed, seventy-one to twenty-nine. Nine days later, the Senate passed the legislation itself, seventy-three to twenty-seven. The two votes accomplished different things: the first broke through the obstruction, and the second approved the bill. A coalition of Democrats and Republicans made the breakthrough possible, with Republican leader Everett Dirksen helping secure support after negotiations over the legislation. A senator unable to speak could still help the chamber reach a decision, while senators exercising their opportunity to speak had been trying to keep that decision out of reach. The procedure was part of a struggle over who would receive the protection of national law. www.senate.gov

It is possible to recognize the achievement of that coalition without pretending that the barrier it overcame was harmless. Negotiation helped produce the votes for passage, and the resulting law demonstrated the strength of support extending across party lines. A defender of supermajority rules can see value in requiring leaders to build such an agreement. Someone examining the years of frustrated civil-rights legislation can see an institution making equal treatment extraordinarily difficult to obtain. These interpretations address different features of the same history: how the eventual agreement was assembled and what the country endured before it could be assembled. The filibuster's record prevents any credible account from treating delay as inherently wise or opposition as inherently courageous. It does not establish that every bill a future majority proposes will deserve passage. A present-day defense of the rule has to confront its use against civil rights, while a present-day case for removing it still has to explain how the country should restrain a majority pursuing a harmful policy. Historical truth sharpens that responsibility instead of relieving either side of it.

There is another complication beneath the familiar instruction to let the majority govern: a majority of senators and a majority of Americans are different measurements. California receives two senators, and Wyoming receives two senators, although their populations are vastly different. A group of forty-one senators can therefore represent

fewer people than the fifty-nine it prevents from advancing a bill. A narrow Senate majority can also represent less than half the national population. Equal state representation can be defended as part of a federal system, in which national and state governments share governing authority, and as a means of preventing the most populous states from overwhelming the rest. The objection is that the filibuster adds another barrier within a chamber already designed to give states equal standing regardless of population. Here, the disagreement concerns which interests deserve additional protection and how much. The Senate's majority is not a direct national referendum, a vote in which the public decides a question itself; its minority is not a complete portrait of every American who fears being overlooked. Treating either group as "the people" without qualification makes the democratic argument simpler than the institution it is supposed to explain. www.archives.gov

Political power also has a way of changing owners before the people using it have finished imagining its consequences. Suppose a majority removes the legislative filibuster to pass a policy it believes the country urgently needs. Its supporters celebrate the end of obstruction, and its opponents warn that the safeguards have been weakened. After another election, the parties exchange positions. The new majority discovers that the procedure does not remember the emergency that inspired the change. It is available for a different program, supported by people who describe the country's needs very differently. A majority seeking national abortion protections and a majority seeking national abortion restrictions could both want a clearer path through the Senate, although either proposal would still face constitutional questions and the other requirements of lawmaking. The same is true of lawmakers seeking stronger gun regulations and lawmakers seeking expanded gun rights. These examples do not make the policies equivalent. They show that procedural power cannot be permanently assigned to one moral judgment. The serious case for majority rule includes accepting that opponents will sometimes win elections and use majority power to enact laws one believes should never have passed.

The Senate's treatment of nominations offers a real example of that inheritance. A nomination is the president's choice of a person for an office requiring Senate approval. In 2013, the Democratic majority established a precedent allowing a simple majority to invoke cloture on executive-branch and judicial nominations other than Supreme Court nominations. In 2017, the Republican majority extended majority cloture to Supreme Court nominations. Confirmation itself generally already required only a majority; the changes reduced the support needed to overcome obstruction and reach that decision. The method became known as the "nuclear option," a politically explosive name for establishing a new procedural precedent through a majority vote overturning the presiding officer's ruling. A precedent is an earlier decision that guides how a rule will be applied in later cases. This route differs from formally rewriting the standing rules, for which ending debate generally requires two-thirds of senators present and voting. The episode illustrates why changing procedure can look like restoring government to one majority and dismantling a protection to another. It also shows why a change cannot be

evaluated only by the officials it helps today. Its practical benefits remain available when a successor takes control. www.everycrsreport.com

The concern about continuity reaches beyond the disappointment of watching an opposing party succeed. A family may arrange its working life around a public benefit. A state may build an administrative system to carry out a federal program. An employer may commit money to a project under requirements expected to remain in force for years. If major policies change sharply whenever control of government changes, people can lose time, money, and confidence trying to adjust. Requiring broader support may encourage laws that survive an election because part of the next governing coalition helped create them. That is a substantial argument for restraint, especially in a country where national decisions reach into millions of daily routines. Yet durability has to be evaluated by what is being preserved. A family excluded from adequate help may experience the same continuity as years of reliable neglect. The employer benefiting from a stable arrangement and the worker seeking to change it may describe its stability differently. A functioning democracy needs both a dependable legal order and a practical way to repair that order when it fails. The filibuster debate concerns the balance between those needs, including how long people can reasonably be asked to wait for correction.

Removing the routine sixty-vote barrier would leave a considerable system of restraint standing around the Senate. The House would still have to approve the same legislative text. A president could still veto it, and overriding that veto would still require the Constitution's supermajorities. Courts could hear challenges to a law's constitutionality. Senators within the governing party could disagree strongly enough to defeat their own leadership's proposal. Even unified party control would not erase differences among members representing different states and constituencies. These limits explain why ending the filibuster would expand a majority's opportunity to govern without making passage automatic. They also explain the disagreement about whether the remaining safeguards would be sufficient. A law can survive constitutional review and still be poorly designed, damaging, or deeply unpopular; judges do not serve as a general committee for deciding whether legislation is wise. Defenders of the filibuster want an additional political restraint before the country has to absorb the consequences. Its critics argue that an elected majority needs enough room to make decisions for elections to provide meaningful responsibility. Both positions require a judgment about how much trust to place in ordinary lawmaking and the public's ability to correct its results. www.archives.gov

The existing system already allows some important legislation to follow a different path. Budget reconciliation is a special process that limits Senate debate on qualifying legislation involving spending, revenue, or the federal debt limit, the statutory ceiling on federal borrowing. Because debate is limited, qualifying bills can reach passage with a simple majority. But reconciliation is not available merely because lawmakers can identify some financial effect of a proposal. The Byrd Rule restricts provisions considered extraneous, or outside the process's permitted purposes, including provisions whose budgetary effects are merely incidental to their other effects. Other

restrictions apply as well. This helps explain a peculiarity of governing under the filibuster: a majority may have a path to substantial changes in taxes and spending while encountering a higher barrier on other subjects. Which promises can be fulfilled depends partly on which promises fit through the available procedure. The rule governing how a proposal reaches a vote can influence what lawmakers decide to put in the proposal at all. www.everycrsreport.com

Between preserving the present practice and allowing most ordinary legislation to advance by majority vote are proposals that change the cost of obstruction. A talking filibuster would require senators seeking to delay action to sustain debate on the floor. Its appeal is easy to understand: people could hear the objections, identify who was blocking the bill, and observe whether the opposition remained committed enough to continue. A speech could inform the country or expose the weakness of an argument that was easier to make through a private threat. Still, a speaking requirement needs a carefully designed conclusion. Keeping the sixty-vote cloture threshold while merely requiring more speeches would not, by itself, guarantee that the majority eventually reached a final vote. Rules governing attendance and other delaying procedures would also shape the outcome. The majority could face substantial demands on its own members' time as it tried to sustain the effort. The useful question is therefore what a particular reform would require each side to do, and what would happen when those requirements could no longer be met. A more dramatic televised scene would be a change in appearance; a dependable path to decision would be a change in governing power. www.everycrsreport.com

Other proposals would move the burden more directly. Under the ordinary cloture rule, sixty affirmative votes are normally required when all one hundred seats are filled, even if some senators are absent. A reform could instead require forty-one senators actually to vote against cloture in order to sustain the obstruction. That would oblige the blocking coalition to assemble its members and repeatedly demonstrate its strength. Another approach would lower the threshold over successive cloture attempts until a simple majority could prevail, giving the minority time to draw attention to a danger, seek amendments, and build public opposition without necessarily allowing it to prevent a decision indefinitely. These ideas reveal an important distinction within the argument about minority rights. Time to warn the country, opportunities to propose changes, and the capacity to keep a bill from receiving a final vote are different kinds of power. A person can favor strong protection for debate while believing that debate should eventually end. Another can believe that the final decision should remain out of reach until a broader coalition has formed. Those positions disagree about what the minority should ultimately be entitled to accomplish, even when both value its opportunity to be heard. www.everycrsreport.com

Exceptions for particular subjects would raise a different problem: deciding which legislation deserves a different rule and who gets to define its boundaries. An exception for election law could encompass expanded voter registration, stricter identification requirements, or other policies favored by different coalitions. Calling the subject urgent

would not reserve the exception for the lawmakers who first established it. Later majorities could bring competing ideas into the same category or create exceptions of their own. A narrowly justified change might remain narrow, or it might become a precedent for steadily expanding majority power. That possibility does not settle whether an exception would be justified; it identifies part of the decision being made. A procedural category can outlast the agreement that created it, and the people who inherit the category may have little interest in preserving the original explanation. The design of the rule therefore deserves the same attention as the first bill expected to benefit from it.

By this point, neither a winning tally nor a plea for patience should be enough to end the discussion. Fifty-one senators can support a harmful bill, and sixty can support one. A compromise can repair a proposal or remove the provision that would have made it effective. A filibuster can protect people from an ill-considered change or protect an ill-considered arrangement from change. The strongest defense of keeping it accepts the frustration of seeing worthy legislation blocked in exchange for a greater barrier when an opposing majority takes power. The strongest case for removing it accepts the risk of opponents enacting unwanted laws in exchange for a government more able to act and more clearly responsible for what it does. The voter watching that stalled bill now has more to evaluate than the claim that one side won and the other side obstructed. There is the substance of the law, the legitimacy of the objections, the possibility of a better agreement, the cost of waiting, and the power being reserved for future governments. A considered position on the filibuster has to hold the bill one desperately wants passed and the bill one desperately wants stopped against the same procedural standard. Only then does “for or against” become a judgment about government rather than a description of whose turn it is to govern.
